

## Osmo+ New Firmware Lens Calibration Guide

After updating the firmware v1.6.1.0 successfully, you need to restart the Osmo+ and launch DJI GO connected to the Osmo+ Wi-Fi.

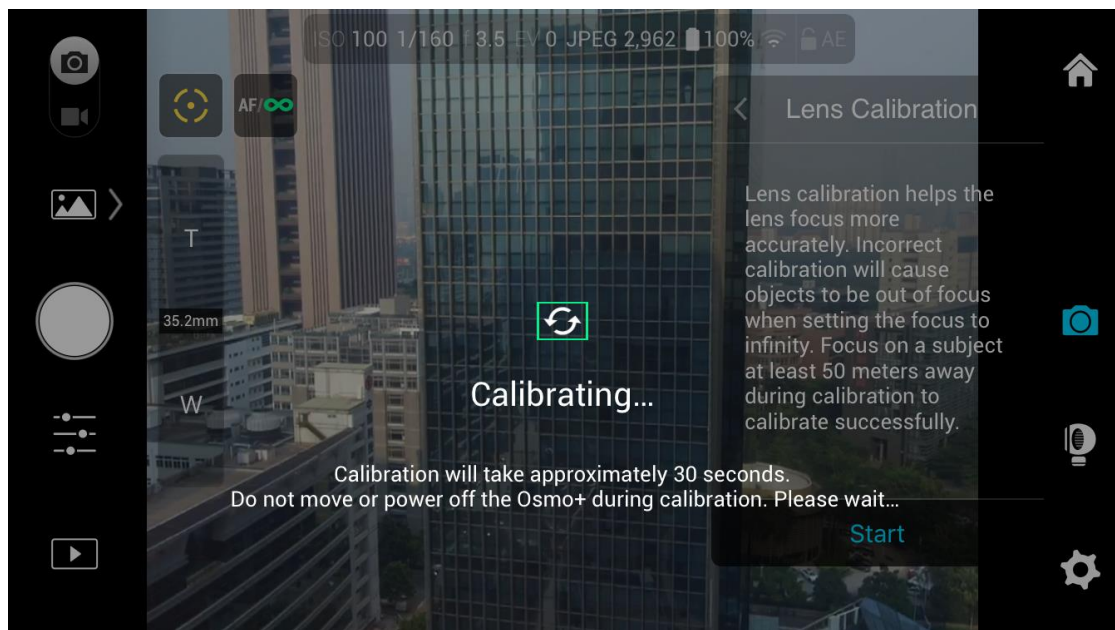

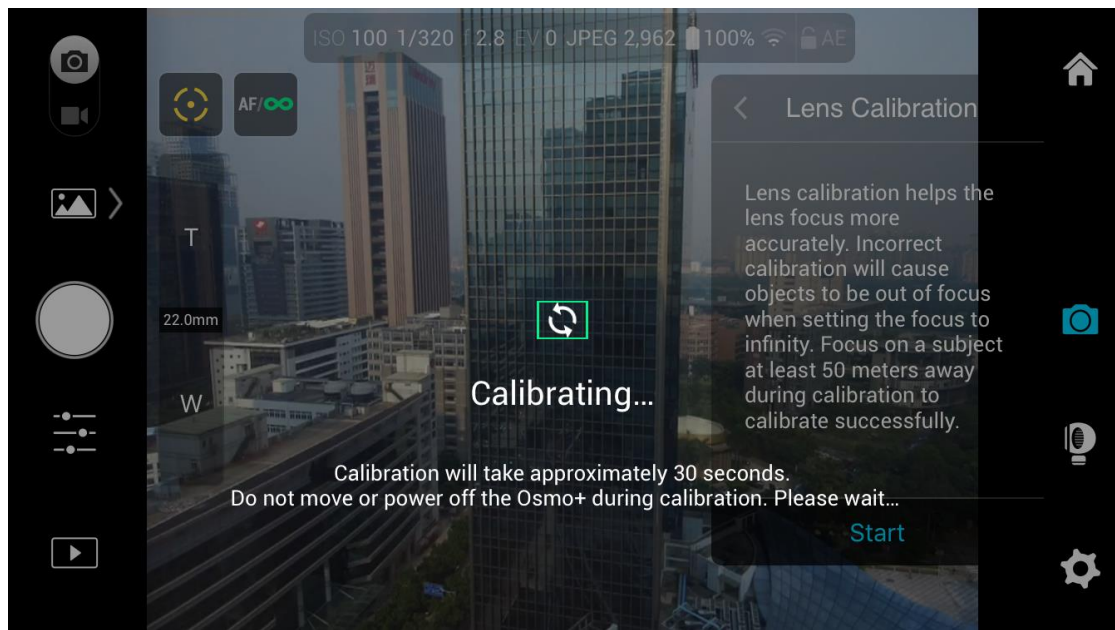

Tap the camera icon and find “Lens Calibration” under Camera.

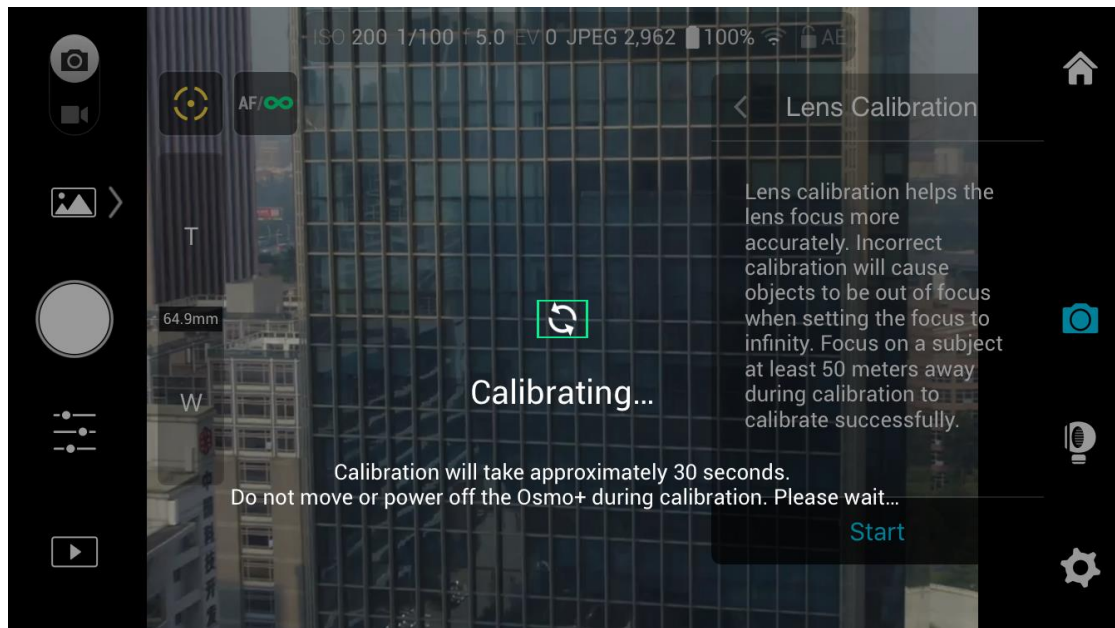

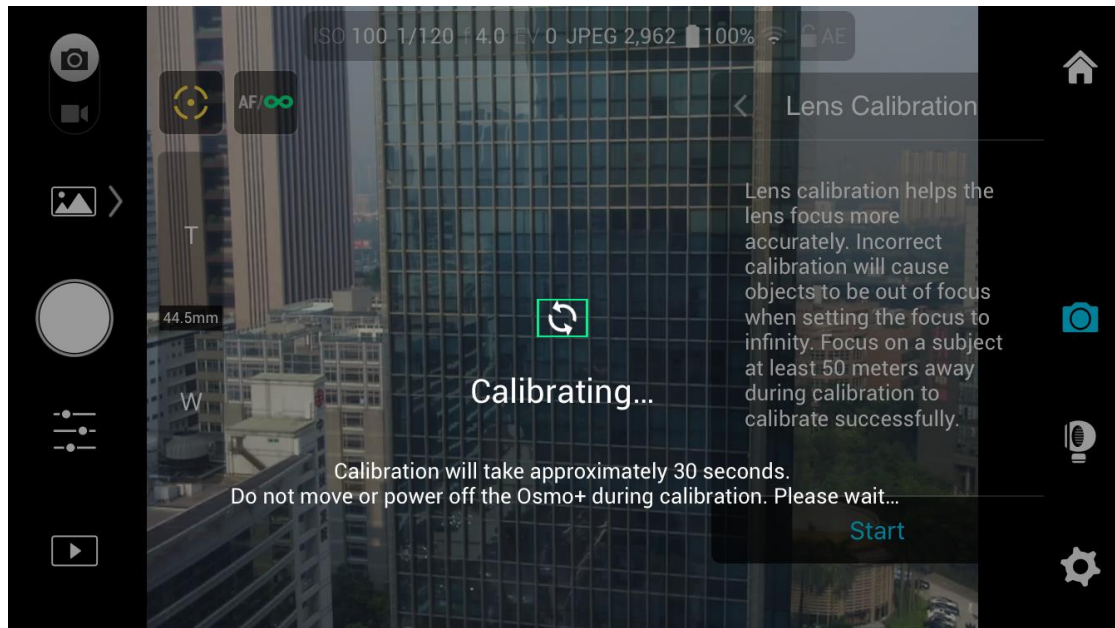

Focus on a subject at least 50 meters away, follow the instructions on the Lens Calibration prompt, and tap “Start”.

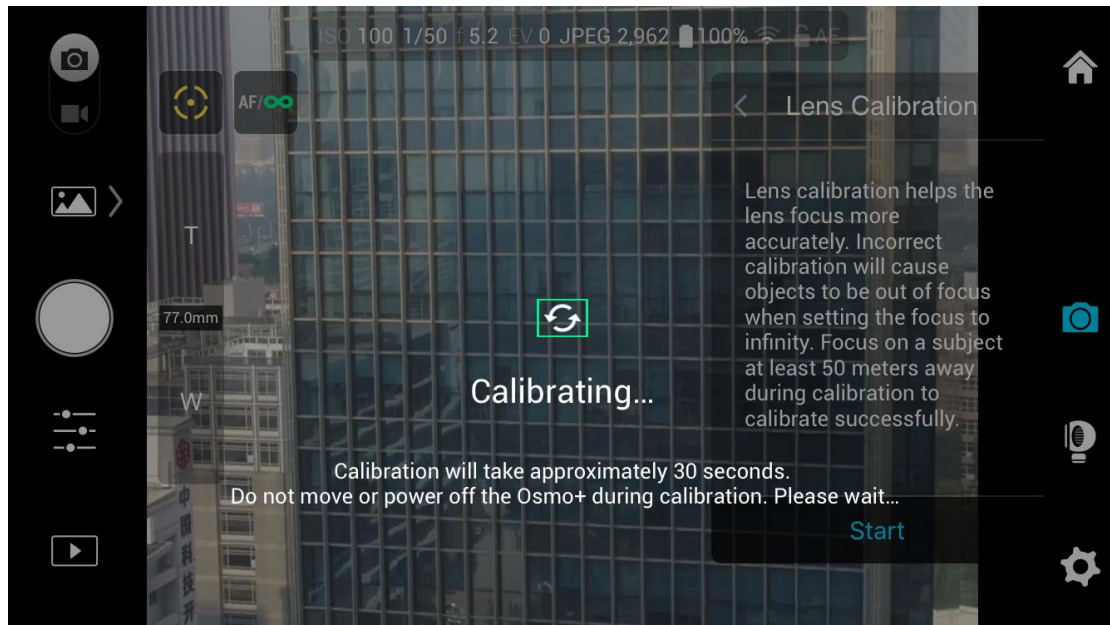

During the calibration, the lens will zoom in and out automatically. The whole process will last about 30 seconds.

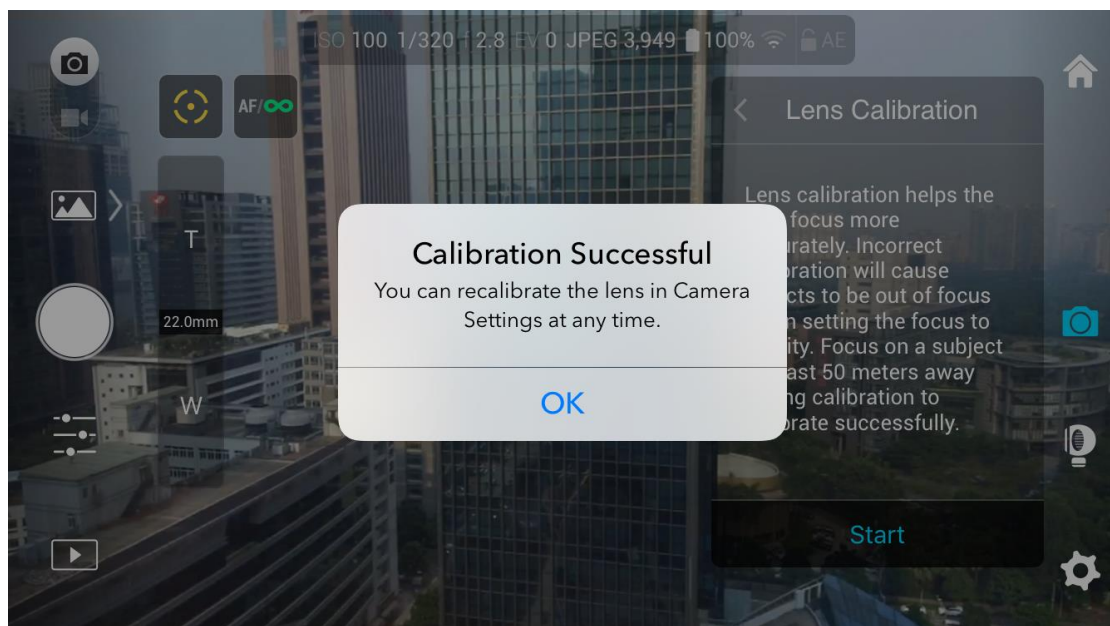

When a “Calibration Successful” prompt pops up, the calibration finishes.

Note:

After the calibration is successful, it is not necessary to calibrate the lens again when you change the shooting environment.
